Working Capital Diagnostic: Nhựa Hà Nội JSC (HNX: NHH)

A cash conversion cycle analysis benchmarked against listed plastics contract manufacturers, FY2023–FY2025

Independent analysis prepared from published financial statements

[Kien Chi Nguyen] · Supporting model: Working_Capital_NHH_Model_EN

1. Executive Summary

This report examines how Nhựa Hà Nội (NHH) manages its working capital and evaluates its remaining opportunity. It covers the three financial years FY2023 to FY2025 and draws exclusively on published consolidated audited financial statements. NHH is benchmarked against four listed comparators: two contract manufacturers with a closely comparable business model (SKP Resources and Sanko Gosei), one global polymer contract manufacturer used as a best-practice reference (Nolato AB), and one domestic plastics producer that serves a different route to market (Nhựa Tiền Phong).

NHH reduced its cash conversion cycle from 71.9 days to 57.5 days over the period, an improvement of 14.4 days. Against FY2025 revenue, one day of cycle time is worth approximately VND 6.3 billion, so the improvement corresponds to roughly VND 91 billion of working capital released over two years.

Three findings stand out.

- The improvement is almost entirely due to inventory. Inventory days fell 19.0 days, from 62.8 to 43.7. Receivable days fell 5.8 days. Payable days moved the other way, falling 10.5 days, which worked against the cycle. Had payable days held at their FY2023 level, the cycle would today stand below 47 days.
- The composition of the cycle is inverted relative to comparable manufacturers. NHH collects roughly 31 days faster than the mean of the two OEM contract manufacturers and pays roughly 28 days sooner. The headline cycle is similar but the underlying funding model is not. In effect, NHH funds its suppliers rather than being funded by them.

- The payables gap is worth approximately VND 148 billion. At the company's implied cost of debt of 5.05%, that capital carries an annual financing cost of about VND 7.5 billion.

These findings show that NHH's remaining working capital opportunity sits on the payables side rather than the receivables side. This matters more than usual at present: the company is in a capital expenditure cycle funded largely by equity issuance, and working capital released internally is non-dilutive funding for that programme.

Table 1

Cash Conversion Cycle Decomposition, FY2023–FY2025 (days)

Cash conversion cycle (days)	FY2023	FY2024	FY2025	Change
Days sales outstanding	51.6	45.7	45.8	(5.8)
Days inventory outstanding	62.8	48.1	43.7	(19.0)
Days payable outstanding	42.5	29.7	32.0	(10.5)
Cash conversion cycle	71.9	64.0	57.5	(14.4)

Note. NHH cut its cash conversion cycle by 14.4 days, but the gain came from inventory while payables moved against it. Average-balance basis; source: consolidated audited financial statements.

2. Scope, Data and Method

All figures are taken from consolidated audited financial statements and all data used are publicly available. Consolidated rather than parent-company statements are used because NHH operates through subsidiaries, and only the consolidated accounts capture the full scale of the manufacturing operation.

The cash conversion cycle is defined as days sales outstanding plus days inventory outstanding less days payable outstanding. All three components use average balances, calculated as the mean of opening and closing positions, so that a single year-end distortion does not drive the result. Days sales outstanding is measured against revenue, days inventory and days payable are measured against cost of goods sold. A 365-day year is applied throughout.

NHH prepares its accounts under Vietnamese Accounting Standards, principally Circular 200/2014/TT-BTC. These were restated into a comparable analytical format, with the reconciliation set out in Appendix B.

The restatement matters for comparability but not for the cycle itself that at the level of trade receivables, inventory and trade payables, the differences between Vietnamese standards and IFRS are immaterial.

Figures are held in each company's own reporting currency. No foreign exchange translation and no translation error as the cash conversion cycle is expressed in days and is therefore currency-neutral.

2.1 Peer selection

The comparator set was built in three layers, each answering a different question.

- Structural peers : SKP Resources and Sanko Gosei. Both manufacture plastic components to customer specification for original equipment manufacturers. Sanko additionally operates a mould and die business, which matches NHH's product mix directly.
- Global reference : Nolato AB. A polymer contract manufacturer reporting under IFRS, used to place the Vietnamese figures against an international standard rather than a regional one.
- Domestic control : Nhựa Tiền Phong (NTP). Same country, same accounting framework, same input cost environment, but a distribution-led route to market rather than build-to-order manufacturing.

One obvious candidate was deliberately excluded. An Phát Bioplastics (AAA) is the closest comparator on sector, exchange and scale, and would ordinarily be the first name in any screen. However, it increased its holding in NHH from 47.44% to 62.75% on 26 September 2024 and has consolidated NHH as a subsidiary since that date. Its FY2025 consolidated accounts therefore contain NHH in full, and comparing the two would mean comparing NHH with a group that includes NHH. AAA is retained in the supporting model for completeness but excluded from every peer average in this report.

3. Company and Industry Context

NHH manufactures precision plastic components and injection moulds to customer specification. Its customers are original equipment manufacturers in the automotive, motorcycle and consumer electronics sectors. This is a build-to-order business, not a branded consumer one, and the distinction shapes everything that follows.

Three features of the model determine how working capital behaves.

- First, inventory is structurally layered. Raw material, work in progress and finished goods each behave differently where raw material is exposed to resin price cycles, work in progress reflects production scheduling against customer call-offs, and finished goods are held against delivery windows the customer sets. The mould business sits on a longer cycle again, with tooling programmes running months rather than weeks and often carrying customer advances against progress.

- Second, receivable days are set by the customer, not by the supplier's collection effort. Large original equipment manufacturers impose standard payment terms across their supply base, and a component maker has very limited scope to negotiate them. Improving days sales outstanding in this business is therefore less a matter of credit control discipline than of customer mix.
- Third, payable days are compressed by the supplier structure. Engineering-grade resin is supplied by a small number of large petrochemical producers who set short terms and offer limited flexibility. A mid-sized converter has weak bargaining power on this side too.

The period under review was not a stable one for the sector. Resin input prices eased from their 2022 peaks, which supported gross margins across Vietnamese plastics producers but also allowed inventory values to fall without any change in physical volumes. Construction-linked demand remained weak, and profitability diverged sharply between construction plastics and technical plastics. Any reading of NHH's inventory reduction has to account for the price effect as well as the operational one.

Two company-specific developments are relevant. NHH raised equity through the issue of 36.44 million new shares plus 3.64 million shares under an employee scheme, lifting total equity from VND 1,357 billion to VND 1,826 billion in FY2025. At the same time it announced a substantial expansion of mould-making and technical plastics capacity, and construction in progress rose accordingly. The company is, in short, in an investment phase funded by equity.

4. Working Capital Performance, FY2023–FY2025

NHH's cash conversion cycle improved in each year of the period, from 71.9 days in FY2023 to 64.0 days in FY2024 and 57.5 days in FY2025. This improvement of 14.4 days is substantial for a manufacturer of this type, and it is monotonic rather than the product of a single favourable year.

Decomposing the change tells a more specific story than the headline does.

Table 2

Contribution of Each Component to the 14.4-Day Improvement (days)

Contribution to the 14.4-day improvement	Days	Direction
Inventory days	(19.0)	Improved the cycle
Receivable days	(5.8)	Improved the cycle
Payable days	(10.5)	Worked against the cycle
Net change	(14.4)	—

Note. The entire improvement, and more, came from inventory; the payables line moved in the wrong direction.

Inventory days fell from 62.8 to 43.7, a reduction of 19.0 days. This is the dominant driver and it is worth roughly VND 100 billion of cost of goods sold at FY2025 levels. Part of the fall reflects genuine operational tightening; part reflects lower resin prices, which reduce the carrying value of the same physical stock. The published accounts do not permit these two effects to be separated, and this report does not attempt to allocate between them.

Receivable days fell 5.8 days, from 51.6 to 45.8, and were essentially flat between FY2024 and FY2025. Given that terms in this segment are largely set by the customer, stability here is the expected outcome rather than a shortfall.

Payable days moved against the cycle, falling from 42.5 days in FY2023 to 32.0 days in FY2025. NHH is settling with its suppliers faster than it did two years ago. This is the finding that motivates the comparison in the next section, because it runs counter to what a working capital programme would normally produce. Had payable days simply held at their FY2023 level, the cycle would now stand at approximately 47 days rather than 57.5.

4.1 Converting the cycle into money

At FY2025 revenue of VND 2,311 billion, one day of cycle time is worth approximately VND 6.3 billion. On that basis the working capital tied up in the operating cycle at the FY2025 year end was approximately VND 364 billion, and the 14.4-day improvement corresponds to roughly VND 91 billion released over the two years.

As a robustness check, days payable was recalculated on a purchases basis, defined as cost of goods sold plus the movement in inventory, which is the theoretically preferable denominator. That basis gives 46.1, 29.9 and 31.7 days across the three years against 42.5, 29.7 and 32.0 on the cost-of-goods-sold basis. The difference is immaterial and does not alter any conclusion in this report. The cost-of-goods-sold basis is used throughout for comparability, because the peer companies do not disclose the inventory movement needed to construct purchases consistently.

5. Peer Benchmarking

5.1 The headline comparison

On the headline measure NHH sits comfortably within the group of contract manufacturers.

Table 3

Cash Conversion Cycle by Company, FY2025 (days)

FY2025 (days)	NHH	SKP	Sanko	Nolato	NTP
Days sales outstanding	45.8	80.5	73.7	60.9	20.6
Days inventory outstanding	43.7	37.4	39.0	53.6	95.8
Days payable outstanding	32.0	63.2	57.3	31.9	23.1
Cash conversion cycle	57.5	54.7	55.3	82.6	93.3

Note. A similar headline cycle conceals two entirely different funding models. Fiscal years as reported; SKP closes 31 March and Sanko closes 31 May.

NHH's 57.5 days compares with 54.7 at SKP Resources and 55.3 at Sanko Gosei. Read alone, this would suggest that NHH has essentially converged with its structural peers and that little further opportunity exists. That reading would be wrong, and the reason is visible only once the cycle is decomposed.

5.2 The composition is inverted

Table 4

Cycle Composition, NHH Versus the OEM Peer Mean, FY2025 (days)

FY2025 (days)	NHH	OEM peer mean	Gap
Days sales outstanding	45.8	77.1	(31.3)
Days inventory outstanding	43.7	38.2	5.5
Days payable outstanding	32.0	60.3	(28.3)
Cash conversion cycle	57.5	55.0	2.5

Note. NHH collects about 31 days faster than comparable manufacturers and pays about 28 days sooner. The two effects nearly cancel in the headline and hide each other. OEM peer mean is the average of SKP Resources and Sanko Gosei.

This is the central finding of the report. NHH holds a materially stronger receivables position than either structural peer and a materially weaker payables position. The two deviations are of similar magnitude and opposite sign, so they very nearly cancel in the headline number. A reader who looks only at the cash conversion cycle would conclude that NHH is unremarkable. A reader who decomposes it finds a company operating a different funding model from its peers.

The differences are best explained structurally rather than as judgements about management quality.

SKP Resources carries days sales outstanding of 80.5. Roughly 70% of its revenue comes from a single customer, and that concentration cuts both ways: it delivers volume and scale, but it also means payment terms are dictated rather than negotiated. The vulnerability became visible after the period under review, when order reductions from that customer combined with tariff pressure caused a sharp reversal in profitability. NHH's customer base is concentrated but not to that degree, which is one reason its receivable days are lower.

Sanko Gosei carries days sales outstanding of 73.7 despite disclosing no single customer above 10% of revenue. Concentration therefore cannot explain its position. The more likely explanation is settlement practice: a significant share of Japanese trade receivables is settled by promissory note and by electronically recorded monetary claims rather than on open account, and these instruments carry longer effective terms. Both are included in the calculation here, as they must be — excluding them would understate Sanko's receivable and payable days by a wide margin and would have made the comparison meaningless.

It is worth being explicit that customer concentration and receivable days do not line up monotonically across the three companies. Sanko has the least concentrated customer base and the second-highest receivable days; SKP has the most concentrated and the highest. Concentration is therefore one factor among several, and national settlement conventions appear to matter at least as much. Forcing a single explanatory variable onto the data would be a misreading.

On the payables side, both structural peers operate at roughly twice NHH's days payable outstanding. Part of this is genuine and part is measurement. SKP reports trade and other payables as a single line in every annual report, so its 63.2 days is an upper bound and its cycle a lower bound. Sanko's 57.3 days reflects, in part, the same note-based settlement convention that lengthens its receivables. Adjusting for both, a realistic peer benchmark for NHH is lower than 60.3 days, but still well above 32.0.

5.3 Two controls

Nolato AB carries the highest cycle of any contract manufacturer in the set at 82.6 days, which is counterintuitive for the company used as the best-practice reference. Its inventory days of 53.6 are well above the OEM peers. The explanation is product mix: a substantial share of Nolato's output serves medical and pharmaceutical customers, where qualification requirements and supply security demand deeper inventory, and where margins are correspondingly wider. Nolato earned an operating margin above 11% in FY2025 with an equity-to-assets ratio of 60%. The lesson is that the cash conversion cycle cannot be read in isolation from profitability: a longer cycle that buys a wider margin may be the correct commercial choice.

Nhựa Tiền Phong provides the opposite control. It operates in the same country, under the same accounting framework, with the same input cost environment, yet carries a cycle of 93.3 days built on inventory days of 95.8 and receivable days of just 20.6. That signature belongs to a distribution model: stock is held centrally to serve a dealer network, and dealers pay quickly. The contrast establishes that the differences observed between NHH and its international peers arise from the business model rather than from the Vietnamese operating environment.

6. Sizing the Payables Gap

The gap identified in Section 5 can be converted into a monetary figure in four steps.

Table 5

Quantification of the Payables Gap, FY2025

Step	Calculation	Result
1	FY2025 cost of goods sold divided by 365 — one day of payables	VND 5.24 billion
2	OEM peer mean days payable less NHH days payable	28.3 days
3	Gap in days multiplied by one day of payables	VND 148 billion
4	Released capital multiplied by implied cost of debt of 5.05%	VND 7.5 billion per year

Note. Closing the payables gap to the peer mean would release approximately VND 148 billion, carrying an annual financing cost of about VND 7.5 billion at the company's current cost of debt.

Two qualifications are essential, and neither is a formality.

First, part of the gap is structural and cannot be closed. SKP's reported payables include non-trade items, so its 63.2 days overstates its true trade payables position. Sanko's figure partly reflects Japanese note-based settlement, a convention that does not exist in the Vietnamese market. A realistic target for NHH would capture some fraction of the 28.3-day gap, not all of it. This report deliberately does not estimate that fraction, because the published accounts do not contain the information needed to do so credibly.

Second, extending payment terms is not costless. Suppliers may price longer terms into unit costs, and early-settlement discounts may already be being captured. Neither is visible in published financial statements. A firm conclusion on whether NHH should pursue this would require the supplier contract terms and the discount schedule, which are internal information.

What can be said with confidence is narrower but still useful: the gap is large, it is concentrated in a single component of the cycle, and it is worth investigating with internal data. Given that NHH is currently funding a capacity expansion through equity issuance, capital released from working capital is non-dilutive funding, and its value to shareholders is therefore higher than the interest saving alone would suggest.

7. Limitations and Sensitivities

The following would change or qualify the conclusions above.

- Fiscal year misalignment. SKP Resources closes on 31 March and Sanko Gosei on 31 May. Their FY2025 figures therefore overlap mainly with calendar 2024. Comparisons are made on a fiscal-year-as-reported basis and no attempt has been made to calendarise them.
- SKP payables cannot be split. Trade and other payables are reported as a single line in every SKP annual report. Its days payable is an upper bound and its cycle a lower bound. This is disclosed rather than estimated away.
- Accounting standards differ across the set: Vietnamese standards, Malaysian Financial Reporting Standards, Japanese GAAP and IFRS. At the level of the three working capital lines the differences are small, but they are not zero.
- Receivables financing is not visible. If any company in the set factors receivables or discounts notes, its days sales outstanding is understated. Note discounting is common practice in Japan. Published disclosure is not sufficient to test this.
- Two-point average balances do not capture intra-year seasonality. A manufacturer with concentrated shipment windows may carry materially different working capital mid-year.
- The inventory reduction is not decomposed between price effect and volume effect. Resin prices fell over the period, and published accounts do not permit the two to be separated.
- FY2023 return ratios use closing balances. The FY2022 balance sheet was obtained for receivables, inventory and payables but not for total assets, so return on assets, return on equity and the DuPont decomposition for FY2023 are indicative only. The cash conversion cycle is not affected.

One further observation deserves note rather than adjustment. NHH's effective tax rate rose from 20.2% in FY2023 to 26.1% in FY2025, above the statutory rate. The company disclosed tax assessments and penalties totalling over VND 4 billion during the period, which may account for part of the movement. This does not affect the working capital analysis but would need to be understood before drawing conclusions about earnings quality.

8. Conclusion and Next Steps

NHH has run a successful working capital programme over the past two years, and the result is visible: 14.4 days of cycle time removed, worth approximately VND 91 billion. That programme has, however, concentrated almost entirely on inventory. The receivables position was already strong relative to comparable manufacturers and has little room to improve. The payables position is the outlier, and it has moved in the wrong direction over the same period.

The company therefore appears to be operating a funding model in which it extends favourable terms to suppliers while receiving relatively favourable terms from customers. Whether that is a deliberate commercial choice — for instance to secure resin supply or capture settlement discounts — or an unexamined legacy of past practice cannot be determined from published information. That question is the natural next piece of work.

Four steps would resolve it, each requiring internal data:

- Review supplier contract terms against actual settlement dates, to establish whether NHH is paying earlier than contractually required.
- Quantify early-settlement discounts currently being captured, and compare the effective annualised return against the 5.05% cost of debt.
- Analyse receivables ageing by customer, to test whether the strong headline receivable days conceals concentration in a small number of slow accounts.
- Split inventory days between the moulding and tooling businesses, since the two carry materially different natural cycles and a blended figure may be obscuring both.

The method applied here is portable. Any contract manufacturer with published accounts and a comparable peer set can be assessed the same way, and the decomposition step — rather than the headline cycle — is where the insight consistently sits.

Appendix A. Peer Set Specification

Table 6

Peer Set Specification

Company	Listing	Currency	FY end	Standard	Role
Nhựa Hà Nội	HNX: NHH	VND	31 Dec	VAS	Subject
SKP Resources	Bursa: SKP	MYR	31 Mar	MFRS	Structural peer; single customer c.70% of revenue

Company	Listing	Currency	FY end	Standard	Role
Sanko Gosei	TSE: 7888	JPY	31 May	JGAAP	Structural peer; moulding and mould dies; no customer above 10%
Nolato AB	STO: NOLA-B	SEK	31 Dec	IFRS	Global best-practice reference
Nhựa Tiền Phong	HNX: NTP	VND	31 Dec	VAS	Domestic control; distribution model
An Phát Bioplastics	HOSE: AAA	VND	31 Dec	VAS	Excluded — parent of NHH since 26 Sep 2024

An Phát Bioplastics (HOSE: AAA) meets every screening criterion for inclusion — same sector, same exchange, comparable scale — but was excluded on inspection of the ownership disclosures. It raised its holding in NHH from 47.44% to 62.75% on 26 September 2024 and has consolidated NHH as a subsidiary since that date, so its consolidated accounts contain the subject company in full. It is retained in the underlying model for completeness but excluded from every peer average in this report.

Appendix B. Restatement of Vietnamese Accounting Standards to an Analytical Format

NHH, NTP and AAA prepare their accounts under Vietnamese Accounting Standards, principally Circular 200/2014/TT-BTC. The statutory presentation differs from the format used by the international peers, so the following mapping was applied before any ratio was computed. The restatement is presentational, it re-groups disclosed line items and does not adjust any recognition or measurement.

Table B1

Mapping of Vietnamese Statutory Line Items to the Analytical Format

Analytical line	VAS source (statement code)	Treatment applied
Trade receivables	TK 131 — Phải thu khách hàng (short term)	TK 131 only. The aggregate short-term receivables line (MS 130) includes prepayments to suppliers and other non-trade items and is not used for DSO.

Analytical line	VAS source (statement code)	Treatment applied
Inventory	MS 140 — Hàng tồn kho, net of TK 159	Net of the inventory devaluation provision, consistent with peer presentation.
Trade payables	MS 311 / TK 331 — Phải trả người bán (short term)	Short-term trade payables only. Accrued expenses and other payables are excluded.
Other non-current assets	MS 210/240 + MS 250 + MS 260	Aggregated into a single analytical line so that current assets, net fixed assets and other non-current assets reconcile exactly to total assets (MS 270).
Total equity	MS 400 — Vốn chủ sở hữu	Includes non-controlling interests (MS 429), consistent with the total equity measure reported by the peers.
Revenue	MS 10 — Doanh thu thuần	Net of deductions.
Cost of goods sold	MS 11 — Giá vốn hàng bán	As reported.

Note. Line references follow the statement codes prescribed by Circular 200/2014/TT-BTC. The full mapping is implemented in sheet 03_FS_Restated of the supporting model, which carries a reconciliation check to total assets and to total liabilities and equity.

Two points on provisions.

NHH does recognise provisions against both receivables and inventory, and both are small relative to the gross balances. The doubtful-debt provision (TK 139) stood at VND 1.60 billion, 3.64 billion and 3.64 billion across FY2023 to FY2025, equivalent to between 0.7% and 1.2% of gross trade receivables. The inventory devaluation provision (TK 159) stood at VND 2.66 billion, 1.54 billion and 2.15 billion, equivalent to between 0.6% and 1.2% of gross inventory. Because the amounts are immaterial at this scale, the choice between a gross and a net presentation moves the cycle by well under one day and does not affect any conclusion in this report. Inventory is nonetheless taken net throughout, for consistency with the peers.

The peer statements required two comparable definitional decisions, recorded here because they materially affect the benchmark. For Sanko Gosei, trade receivables are the sum of notes receivable, electronically recorded monetary claims and accounts receivable, with the mirror treatment on the payables side; using accounts receivable alone would have understated both its DSO and its DPO by a wide margin. For SKP Resources, trade and other payables are disclosed as a single line in every annual report, so its DPO is an upper bound and its cycle a lower bound.

Appendix C. Ratio Tables and DuPont Decomposition

The ratios below are computed from the restated statements described in Appendix B and are reproduced from sheet 04_Ratios of the supporting model. FY2024 and FY2025 use average balance sheet values; FY2023 uses closing values, because the FY2022 balance sheet was obtained for receivables, inventory and payables but not for total assets and fixed assets. FY2023 return and turnover measures are therefore indicative rather than strictly comparable, and are marked as such. The cash conversion cycle is not affected by this limitation.

Table C1

Selected Financial Ratios, NHH, FY2023–FY2025

Ratio	FY2023	FY2024	FY2025
Current ratio	1.25	1.63	1.82
Quick ratio	0.91	1.20	1.43
Gross margin	14.8%	18.6%	17.3%
Operating margin	5.7%	5.4%	7.0%
Net margin	4.7%	4.2%	5.2%
Return on assets	4.6%	4.4%	5.4%
Return on equity	7.0%	6.4%	7.5%
Return on invested capital	5.0%	5.1%	6.8%
Inventory turnover	7.53x	7.59x	8.35x
Receivables turnover	9.04x	8.00x	7.97x
Payables turnover	13.73x	12.28x	11.40x

Ratio	FY2023	FY2024	FY2025
Debt to equity	0.35	0.23	0.18
Interest coverage	2.55x	5.30x	10.00x

Note. FY2023 return and turnover ratios use closing balance sheet values; FY2024 and FY2025 use average values.

The DuPont decomposition places the working capital improvement in context. Return on equity recovered to 7.5% in FY2025 without any increase in leverage: the equity multiplier fell in each year following the share issue, so the improvement in returns came from margin and from asset efficiency rather than from balance sheet gearing.

Table C2

DuPont Decomposition of Return on Equity, NHH, FY2023–FY2025

DuPont component	FY2023	FY2024	FY2025
Net margin	4.72%	4.19%	5.18%
Asset turnover	0.98x	1.05x	1.04x
Equity multiplier	1.51x	1.47x	1.40x
Return on equity (product)	7.01%	6.44%	7.52%

Note. Return on equity reconciles to the directly computed figure in all three years. FY2023 is computed on closing balances and is indicative.

Two further measures support the discussion in Section 6. The implied cost of debt, calculated as interest expense over average gross debt, fell from 9.46% in FY2023 to 5.35% in FY2024 and 5.05% in FY2025, as gross debt was reduced from VND 486 billion to VND 330 billion. The 5.05% figure is the rate applied to the released capital in Table 5. The effective tax rate, calculated as tax expense over profit before tax, rose from 20.2% to 21.2% and then to 26.1%, moving above the statutory rate in FY2025; the company disclosed tax assessments and penalties during the period, which may account for part of this movement.
